- Quantum circuit
- Gates and single qubit operations

1D Cluster State

$$H = \sum_{a, a' \in \Gamma} \frac{1 + \sigma_z^{(a)}}{2} \frac{1 - \sigma_z^{(a')}}{2}$$

$$\Gamma = \{(a, a') | a' = a + 1\}$$

$$\mathcal{S} = e^{i\pi H}$$

1D Cluster State

$$|\phi_N\rangle = \mathcal{S} \bigotimes_a |+\rangle_a = \frac{1}{2^{N/2}} \bigotimes_a (|0\rangle_a \sigma_z^{a+1} + |1\rangle_a)$$

$$|\phi_2\rangle = \frac{1}{\sqrt{2}}(|0-\rangle + |1+\rangle)$$

$$|\phi_3\rangle = \frac{1}{\sqrt{2}}(|+0-\rangle - |-1+\rangle)$$

$$|\phi_4\rangle = \frac{1}{2}(|0-0-\rangle - |0+1+\rangle + |1+0-\rangle - |1-1+\rangle)$$

$$|\text{GHZ}_N\rangle = \frac{1}{\sqrt{2}} \left(\bigotimes_a |0\rangle_a + \bigotimes_a |1\rangle_a \right)$$

1D Cluster State

- Maximum connectedness
Ability to create Bell state by local measurements.
Yes for both GHZ state and cluster state.
- Persistency
Minimum local measurements to destroy all entanglements.
GHZ: $P_e = 1$, cluster: $P_e = \lfloor N/2 \rfloor$

1D Cluster State

- Maximum connectedness
Ability to create Bell state by local measurements.
Yes for both GHZ state and cluster state.
- Persistency
Minimum local measurements to destroy all entanglements.
GHZ: $P_e = 1$, cluster: $P_e = \lfloor N/2 \rfloor$

- Maximum connectedness
Ability to create Bell state by local measurements.
Yes for both GHZ state and cluster state.
- Persistency
Minimum local measurements to destroy all entanglements.
GHZ: $P_e = 1$, cluster: $P_e = \lfloor N/2 \rfloor$
